## PmailUndup

### Version 2.30

**It is highly recommended that you BACKUP all of your WinPmail folders and exit out of WinPmail before running this program!**

The primary purpose of this program is to find duplicate messages within Pegasus Mail for Windows\* (WinPmail) folders. It will read in the .PMI Index files, and optionally sort the file by the mtime code in ascending order. It will scan for duplicates in the PMI file. A duplicate is defined as an entry in the index file where the from, subject, mtime and size are identical. The actual message text is not checked.

The files are written out as .PMI and .PMM files with any duplicate messages removed and optionally ordered in ascending date order. When the files are written the original files are renamed as .Bkl for the PMI file and BkM for the PMM files.
